

cloud_devices events

The cloud_devices addon notifies a script subscribed by `cloud_devices.subscribe("script_name")` about the state of the cloud devices world. Structure of an event is table.

device_added

is sent when new cloud device has been added

```
{
  event = "device_added",
  id = "<cloud_device_id>"
}
```

fields	type	description
event	string	Type of an event
id	string	Unique id of added cloud device

device_removed

is sent when cloud device has been removed

```
{
  event = "node_removed",
  id = "<device_id>"
}
```

fields	type	description
event	string	Type of an event
id	string	Id of removed cloud device

device_updated

is sent when cloud device has been updated

```
{
  event = "device_updated",
  id = "<cloud_device_id>",
  <changed_field> = <new_value>
  ...
}
```

fields	type	description
event	string	Type of an event
id	string	Id of removed cloud device
<changed_field>	Device field types	Contains new value of device's changed field

command_response

is sent when cloud device has been updated

```
{
  event = "command_response",
  command_id = "<command_id>",
  result = {...},
  error = {...}
}
```

fields	type	description
event	string	type of an event
command_id	string	Command id that was used in corresponding cloud_devices.send_command request

result	object	Contains command result if command succeeded
error	object	Contains error data if command failed
